1. Lo-fi
Looking at the cart page, I wanted to keep the product in theme with the rest of the design. From the Lo-fi I realized that creating clear CTA's is extremely important. After speaking with a couple classmates, they mentioned to make sure the font sizes were clear and large enough. I went ahead and made sure that the final cart page had clear font sizes to show hierarchy. This will allow CTA's to avoid error preventions while still ensuring that the page fits with the aesthetic and minimalist design.

Hi-fi
Users are able to clearly find 2 sets of CTA buttons on the top of the page and on the bottom. This choice was made with the mind set of customers adding multiple items and will allow them to easily find those buttons at all times on the page. Adding a larger font size for the total will also allow users to clearly see the total price. The use of font shows hierarchy and helps to avoid any possibility of missing the final total.

 2. Git Hub Prototype for Javascript (Product Page)
- Adjustable images when clicked
- Adjustable selection for fill, color and quantity
- Add to cart button shows drop down + dot indicator on the shopping bag icon itself
- Selected quantity is reflected in the shopping cart when added to cart
- Price is dynamic and references the quantity in the cart x $45.00
- Fill/Name/Quantity selection references the selection

Problems I faced:
I still am having a hard time adding multiple items to the cart. 1 item renders fine, but 2 items are an issue. I will try and fix this in 6B
